FOXELLI TEST / PRODUCTION PORTFOLIO

The King’s Forbidden Healer

Episode 01 / The Arrow
A royal fantasy about compassion, forbidden power and its price.

Original screenplay: Foxelli
AI video creation & editing: Daria Dovhenko
Final edit: CapCut

The story I worked with

STORY PREMISE / FOXELLI SCREENPLAY

When the King is struck by an arrow, a young healer uses forbidden magic to save him. The wound passes into her own body.

Her act of compassion becomes evidence against her. In prison, she reveals the consequence: if she dies before the wound heals, the King will die too.

How I made the film

The main stages of work on the supplied screenplay

01	**Story breakdown**	I broke the supplied screenplay into scenes, actions and emotional beats.
02	**Visual development**	I developed faces, costumes, locations and props before staging the scenes.
03	**Shot planning**	I prepared storyboards, camera directions and clean START / END references.
04	**Video generation**	I generated the scenes in WAN 3.0, reviewed takes and revised the weaker passages.
05	**Review & edit**	I assembled the film, added music and sound, and corrected color in CapCut.

How I divided the story into scenes

Six production blocks organize the story; their planned durations are distinct from the final edit

01 / The attack	Public ceremony becomes a medical emergency.
02 / The passage	Transport through the palace keeps the injury and urgency visible.
03 / The diagnosis	Conventional medicine reaches its limit.
04 / The choice	She accepts the wound and the danger of discovery.
05 / The arrest	Saving the King places her own life at risk.
06 / The warning	The sentence creates the next episode’s central question.

Choosing the healer’s face and costume

Intermediate character sheet / selected costume C

Selected design: auburn braid, embroidered blue dress, ivory waist apron and herb pouch. The character sheet separates identity and wardrobe from the later wound states.

Choosing the King’s face and costume

Intermediate character sheet / selected costume B

Selected design: black ceremonial clothing, gold embroidery and a long cape. This formal silhouette establishes status before the injury leaves him vulnerable.

Face references and selected costumes

Separate identity and wardrobe references used during development

Healer / selected face

Healer / costume C

King / selected face

King / costume B

The physician and palace guards

Supporting characters give the threat a human face

THE PHYSICIAN

An experienced court medic. His discovery triggers the arrest; the performance direction treats him as a man following the kingdom’s law.

PALACE GUARDS

Grounded costume references and distinct faces support the arrest and prison scenes.

Testing the healer’s expressions

Intermediate expression study

Expression studies provide a vocabulary for the close-ups: fear of discovery, a deliberate choice to act and the physical cost of the transfer.

More expression studies

Intermediate sheets for the King and the featured palace guard

THE KING

Expression studies for the injured King.

THE PALACE GUARD

Reaction studies for the supporting performance.

The recruits’ costume reference

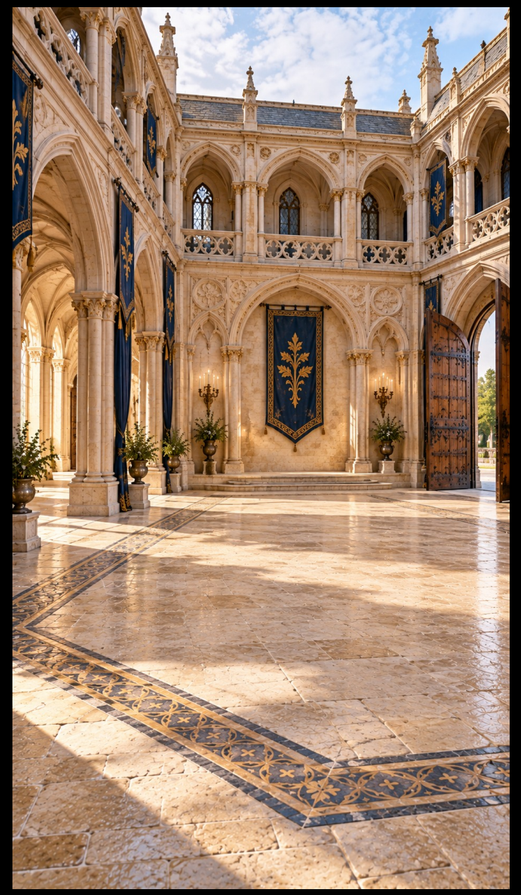

Intermediate character turnaround / ceremony ensemble

The recruit sheet develops a repeatable silhouette for the group at the oath ceremony. Front, profile, back and three-quarter views make the clothing easier to compare across scene references.

Developing the palace and prison

Preproduction location concepts; the ceremonial staging evolved in the final film

THE CEREMONY

Early environment concept: public order and royal scale.

THE BEDCHAMBER

A carved bed and blue velvet make the treatment room worthy of the King.

THE CELL

Cold stone, iron bars and straw turn the final scene into confinement.

Designing the royal bedchamber

Intermediate environment sheet / visual reference, not a measured set

The bed replaces a plain treatment table. Multiple views explore the window, access to the patient and the physician’s doorway before the scene is animated.

Arrow, basin and medical tools

ARROW

A whole, ordinary arrow creates the injury. Its state changes from embedded in the King’s chest to removed into the basin.

BASIN & INSTRUMENTS

The extracted arrow, cloths and medical tools make the treatment legible. Magic begins only after the medical intervention.

Intermediate prop sheets / design and continuity references

Planning the healing scene

Development frame and final-film stills

01 / PLANNED START

Clean reference frame establishes the bedside position before magic.

02 / FINAL FILM

The bedside action holds her hands and the King’s injury in the same frame.

03 / FINAL FILM

Local amber light and blood on her dress make the cost visible.

How I described the healing action

Selected instructions from production prompt P04; the excerpt documents intent

ACTION / CONTACT / CONSEQUENCE

“Warm amber-gold light begins EXACTLY when bare RIGHT palm touches the wound, never before.”

The prompt also specifies the healer’s left-hand support, the King’s closed eyes, the location of both wounds and the moment the glow stops.

Breaking the action into timed beats gives the generation a readable order and makes errors easier to isolate during review.

Transport scene: references and final shot

Intermediate frames remain part of the production history

DEVELOPMENT START

The early transport reference establishes the stretcher and four bearers.

REVISED END FRAME

The doorway reference connects the transport to the royal room.

FINAL FILM

The edited transport passage brings the characters and royal costume into motion.

Ceremony frames before animation

Development images show how the opening and transition were planned

OPENING COMPOSITION: EARLIER > REVISED

Earlier oath composition

Revised opening composition

Gate action / endpoint reference

Transport / revised start reference

Bedchamber scene development

Intermediate scene states prepared before video generation

Treatment / start reference

Treatment / end reference

Discovery / connecting reference

Arrest / revised end reference

Prison scene development

Planning frames / not stills from the delivered film

START REFERENCE

The first composition for the cell sequence.

EARLIER END REFERENCE

An earlier version of the guard’s turn.

REVISED END REFERENCE

The revised frame used in the clean keyframe package.

Close-ups from the final edit

Stills from the delivered film

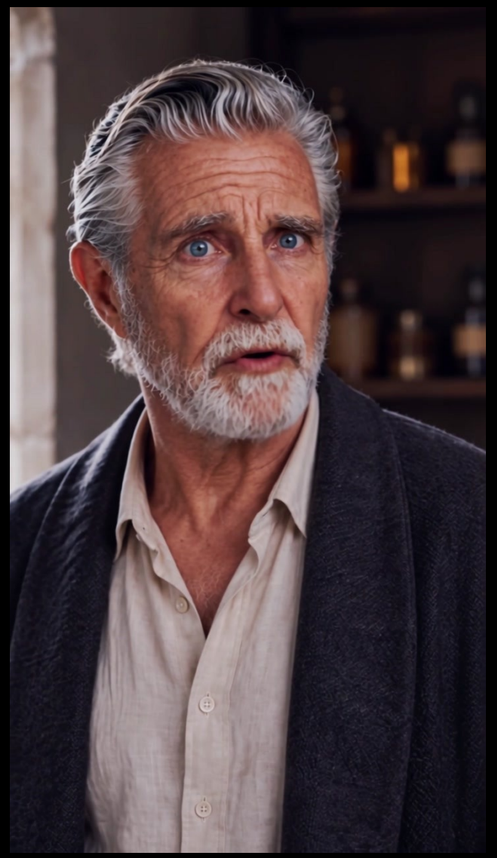

CARE

Physical support puts the relationship ahead of the effect.

VULNERABILITY

A close-up holds on the unconscious King.

DISCOVERY

The physician’s reaction changes the meaning of her action.

The arrest and the final prison scene

Final-film stills / final assembly in CapCut

THE ARREST

The scene widens as the guards take control.

THE SENTENCE

A cold, confined frame replaces the bright palace.

THE CLIFFHANGER

Her warning binds her survival to the King’s future.

Editing the physician’s dialogue scene

EDITORIAL DEVELOPMENT / FINAL-FILM STILL

A repair pass addressed a camera jump in the physician’s diagnosis shot. The development edit selected the stable opening, then cut to the King’s reaction while retaining the complete spoken diagnosis.

This makes the medical information audible across a change of picture. In the wider edit, dialogue, breath and reaction shots carry the tension before the magical effect.

Daria Dovhenko assembled the final delivery in CapCut.

I also developed the opening titles

Separate title artwork and a short animated intro for each film

TITLE ARTWORK

I developed a separate opening title for the film, using gold lettering on black and a jewel detail that connects it to the story’s visual style.

ONE-SECOND ANIMATION

A gentle push-in and a restrained highlight add movement while keeping the letters stable.

The title and its animation were a separate stage alongside character design, scene generation and editing.

Sound, music and color correction

Finishing the generated scenes in CapCut

SEPARATE SOUND ELEMENTS

Alongside the audio in the generated clips, I generated separate sound elements and fitted them to the edit. Sound needed its own pass rather than relying entirely on the video model.

MUSIC & MIX

I added music to support the mood and adjusted it around the voices and scene sounds. The dialogue needed to remain clear through the tension and the transitions.

COLOR CORRECTION

I applied color correction in CapCut to bring the separately generated shots closer together and keep the film’s overall look coherent.

What I would regenerate with more budget

WHAT WENT WRONG

There were many unsuccessful images and video takes. Some changed the character, costume or props; others had awkward movement or did not follow the intended action.

HOW I WORKED AROUND IT

I revised prompts and references, compared takes and used the workable passages in the edit. Rejected versions were kept. The budget limited how many additional takes I could generate.

WHAT I WOULD REGENERATE

With a larger budget, I would regenerate some scenes. I can see room for more natural movement and performances, steadier camera work and more consistent details between shots.

My role and the tools I used

CREDIT / TOOL	CONTRIBUTION
Foxelli	Original screenplay and story premise
Daria Dovhenko	Visual development, AI video, titles, sound and final montage
ChatGPT image generation	Character, environment, prop and keyframe development
Seedream 4.5 / Higgsfield	Earlier casting, wardrobe and visual exploration
WAN 3.0	AI video generation, performance and dialogue passages
CapCut	Editing, color correction, music, sound and final export

The images in this portfolio are labelled as development references or final-film stills. Reference sheets document the design process; the delivered MP4 is the final viewing version.

The finished video

FULL EPISODE / CREATIVE VERSION

01:53

FORMAT	Vertical 9:16
RESOLUTION	1440 x 2560 pixels
FRAME RATE	30 fps
ENCODING	HEVC / AAC stereo
