FOXELLI TEST / PRODUCTION PORTFOLIO

Stealing the Vampire

A supernatural romance thriller
A jewel theft becomes a rescue, then a pursuit.

Original screenplay: Foxelli
AI video creation & editing: Daria Dovhenko
Final edit: CapCut

The story I worked with

STORY PREMISE / FOXELLI SCREENPLAY

Juno enters Celeste Armand’s private exhibition to steal a red stone. Inside the coffin beneath it, she finds Ronan: alive, restrained and far more dangerous than he first appears.

When escape becomes possible, Juno chooses to return for him. Their alliance begins with an act of trust and ends with a new threat on their trail.

How I made the film

The main stages of work on the supplied screenplay

01	**Story breakdown**	I broke the supplied screenplay into scenes, actions and emotional beats.
02	**Visual development**	I developed faces, costumes, locations and props before staging the scenes.
03	**Shot planning**	I prepared storyboards, camera directions and clean START / END references.
04	**Video generation**	I generated the scenes in WAN 3.0, reviewed takes and revised the weaker passages.
05	**Review & edit**	I assembled the film, added music and sound, and corrected color in CapCut.

How I divided the story into scenes

The story moves from an enclosed exhibition to an open pursuit

01 / The stone	A precise theft is interrupted by a knock from inside the coffin.
02 / The captive	Juno discovers Ronan and the restraints that hold him.
03 / The hiding place	The arrival of guards forces the pair into dangerous proximity.
04 / The return	Juno chooses to free him rather than leave alone.
05 / The release	The ankle restraint comes off; the collar remains.
06 / The locked door	His strength fails against the collar. Her skills open the way.
07 / The getaway	She helps him into the car as Celeste closes in.
08 / The pursuit	An exchange of names gives way to the tracker and a following car.

Choosing Juno’s face and evening dress

Intermediate wardrobe and identity sheet

A black evening dress allows Juno to belong at the exhibition. The character direction keeps her alert, resourceful and dryly amused, with a thief’s attention to hands, locks and exits.

Developing Ronan’s look and costume

Intermediate character sheet / collar continuity

The gray shirt, dark trousers and metal collar establish a restrained captive. Weakness is carried through posture and performance while the face retains the appeal required for the romantic lead.

Juno’s face from several angles

Intermediate identity sheet

Front, profile and three-quarter views were prepared separately from the full-body costume sheet. These references helped compare the face and hairstyle as camera positions changed.

Developing Celeste’s appearance

Intermediate body and head-angle sheets

COSTUME & SILHOUETTE

FACE & HAIRSTYLE

The burgundy gown, formal styling and face references were developed as a separate supporting-character package.

Guard references and casting studies

Current video references and earlier casting options are labelled separately

Guard A / reference from an existing video

Guard A / turn reference

Guard B / early face study A

Guard B / early face study B

Testing Juno’s and Ronan’s expressions

Expression references support the progression from suspicion to a fragile alliance

JUNO

Curiosity, appraisal and a flicker of attraction. Her choice to help stays active and deliberate.

RONAN

Pain and exhaustion sit beside awareness and self-control. His restraint makes the intimacy possible.

Developing the exhibition and escape locations

Final-film stills with an intermediate environment concept

THE PUBLIC FACE

Celeste’s reception establishes privilege and control.

DEVELOPMENT / GREEN SALON

Dark green walls and warm practical light frame the hero prop.

THE OUTSIDE WORLD

Wet pavement and cooler night light shift the story into pursuit.

Designing the coffin

A hero prop must support theft, discovery, concealment and release

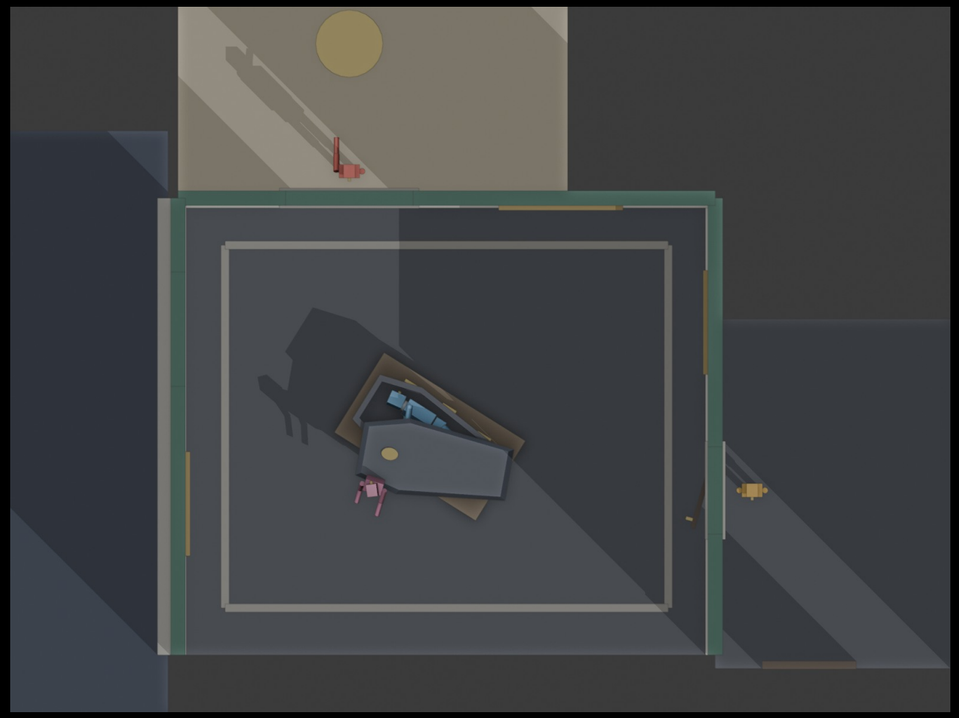

Open and closed studies define the silhouette, lining, removable lid and red stone. The chamber must still allow the camera to read the hands, the captive and the approach of the guards.

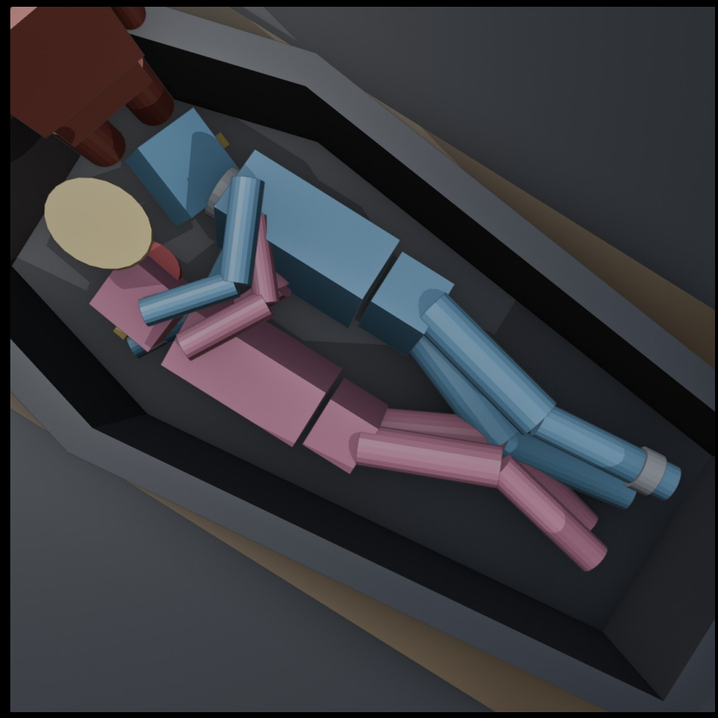

Planning the positions inside the coffin

Existing Blender blockout renders explore the room and action before detailed imagery

ROOM & ACCESS

A top view explores the coffin’s relation to doors and the camera.

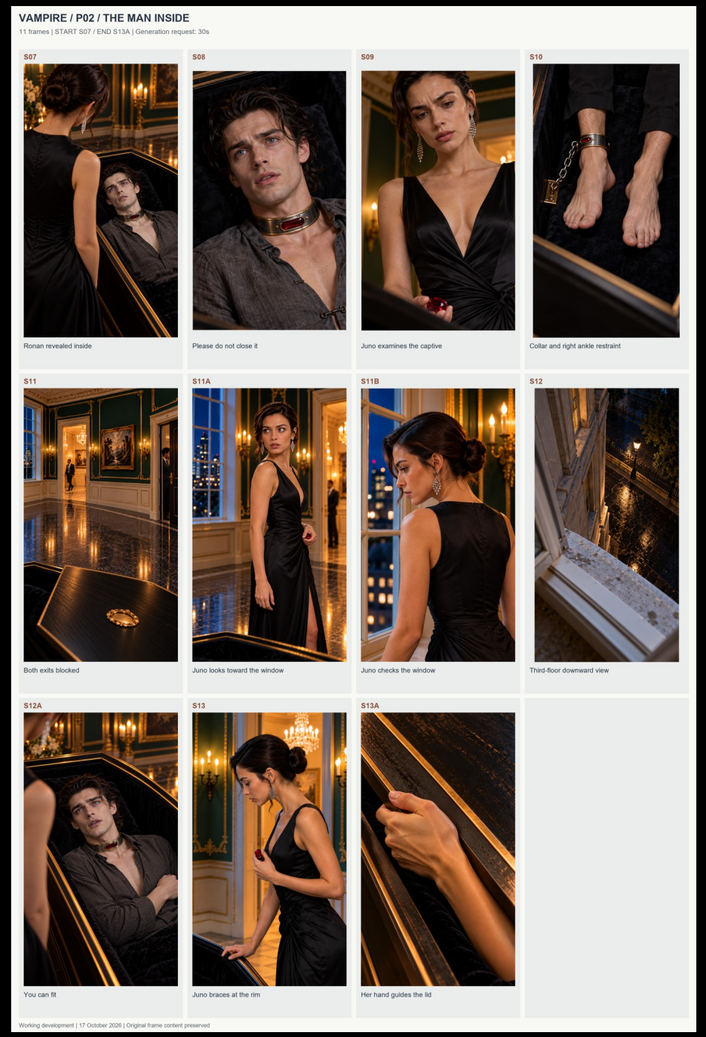

TWO PEOPLE / ONE HIDING PLACE

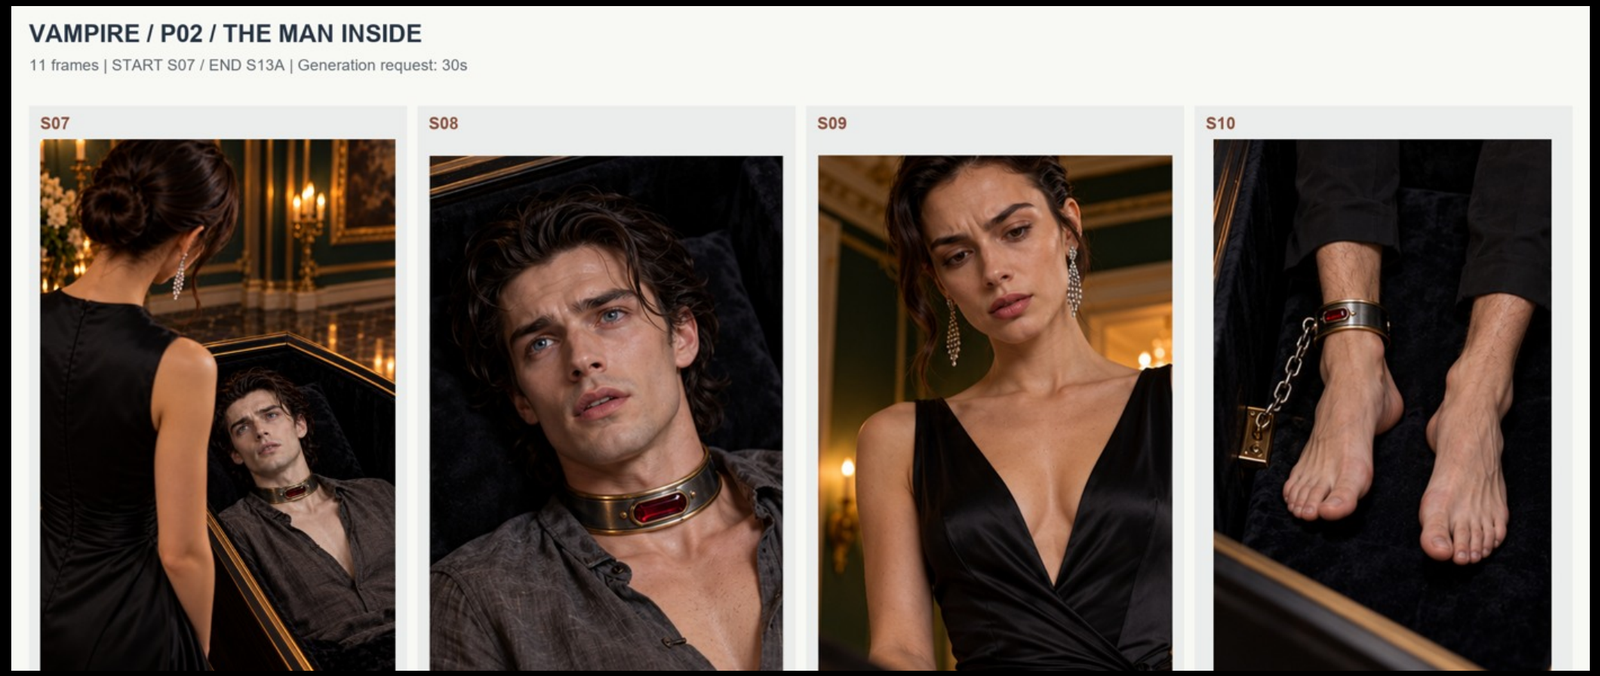

A staging study explores concealment and body placement. It supports planning; the final film determines the performed action.

Storyboarding Ronan’s first appearance

Intermediate production storyboard / sequence P02

FULL PRODUCTION BOARD

REVEAL

The captive’s face and restraints establish who is inside the coffin.

REACTION

Juno’s response and the guards’ arrival connect the discovery to danger.

ESCAPE

Wider views restore the room and its exits.

The eight-sequence package keeps annotated boards, clean START / END images and exact video prompts as separate assets.

Start and end frames for video generation

Boundary references are separate from the annotated storyboard sheet

DEVELOPMENT / START

A clean image reference establishes the opening situation.

DEVELOPMENT / END

The end reference gives the generation a destination.

FINAL FILM

The finished reveal combines the prop, performance and camera position.

Writing the theft scene prompt

Selected P01 directions show how the theft sequence was specified

VISUAL ACTION

“close overhead object-and-hands insert; BOTH hands are JUNO’S FEMALE hands.”

PERFORMANCE & AUDIO

Juno’s inner narration is specified as voice-over without lip movement. Guard radio remains an off-screen voice. Dialogue sits ahead of ambience.

The prompt gives the theft an order: tool, stone, empty bezel, knock, reaction. Each detail can then be checked against a generated take.

Keeping the collar and ankle restraint consistent

ANKLE RESTRAINT / COLLAR

The ankle restraint can be released. The collar stays on after the escape and returns as the tracker in the car scene.

Planning the theft in individual shots

Selected frames from the working storyboard / before animation

S01 / development frame

S03 / development frame

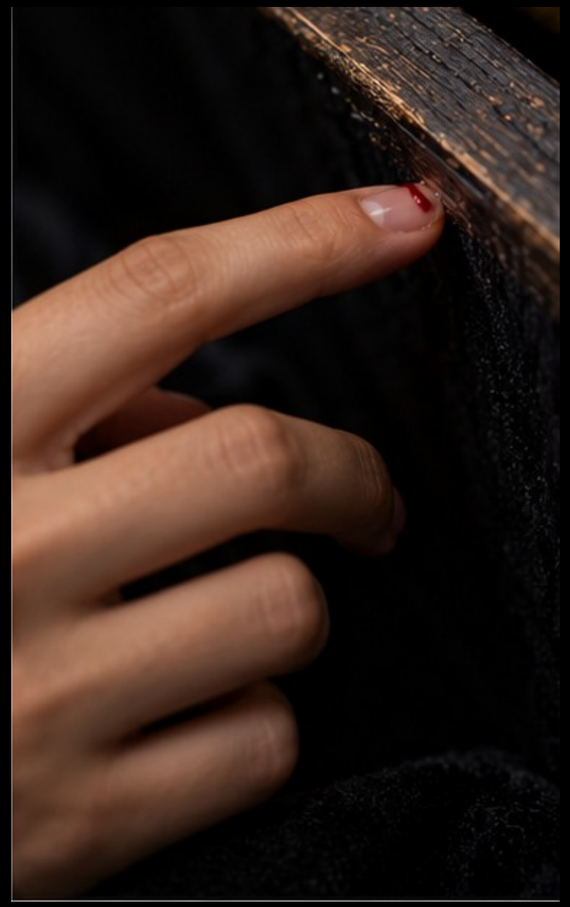

S04 / development frame

S06 / development frame

Planning the hiding sequence

Intermediate camera positions and an updated supporting-character frame

S15 / development frame

S16 / development frame

S17A / development insert

S18 / revised guard reference

Planning the corridor and escape

Working storyboard frames / the final edit is shown on the following pages

S31 / development frame

S32 / development frame

S34 / development frame

S36 / development frame

Close-ups from the final edit

Stills from the delivered film

PROXIMITY

The hiding scene tightens the frame around both faces.

VULNERABILITY

Ronan’s close-up holds his collar and exhaustion in view.

ACTION

A hand-and-tool insert makes Juno’s rescue a practical act.

Editing the escape and car chase

Final-film stills / final assembly in CapCut

THE OBSTACLE

The corridor makes physical weakness part of the escape.

THE GETAWAY

Juno supports Ronan into the front passenger seat.

THE HOOK

A following vehicle keeps the threat alive beyond the rescue.

Improving the walk to the car

EDITORIAL DEVELOPMENT / FINAL-FILM STILL

The development edit included a dedicated repair pass for the walk toward the car after an earlier version felt jerky. The revised passage selected native frames and used a smooth crop to follow the movement.

Audio direction separates Juno’s inner narration, spoken dialogue and off-screen guard radio. Physical cues such as the coffin knock and the collar signal help connect the action.

Daria Dovhenko assembled the final delivery in CapCut.

I also developed the opening titles

Separate title artwork and a short animated intro for each film

TITLE ARTWORK

I developed a separate opening title for the film, using gold lettering on black and a jewel detail that connects it to the story’s visual style.

ONE-SECOND ANIMATION

A gentle push-in and a restrained highlight add movement while keeping the letters stable.

The title and its animation were a separate stage alongside character design, scene generation and editing.

Sound, music and color correction

Finishing the generated scenes in CapCut

SEPARATE SOUND ELEMENTS

Alongside the audio in the generated clips, I generated separate sound elements and fitted them to the edit. Sound needed its own pass rather than relying entirely on the video model.

MUSIC & MIX

I added music to support the mood and adjusted it around the voices and scene sounds. The dialogue needed to remain clear through the tension and the transitions.

COLOR CORRECTION

I applied color correction in CapCut to bring the separately generated shots closer together and keep the film’s overall look coherent.

What I would regenerate with more budget

WHAT WENT WRONG

There were many unsuccessful images and video takes. Some changed the character, costume or props; others had awkward movement or did not follow the intended action.

HOW I WORKED AROUND IT

I revised prompts and references, compared takes and used the workable passages in the edit. Rejected versions were kept. The budget limited how many additional takes I could generate.

WHAT I WOULD REGENERATE

With a larger budget, I would regenerate some scenes. I can see room for more natural movement and performances, steadier camera work and more consistent details between shots.

My role and the tools I used

CREDIT / TOOL	CONTRIBUTION
Foxelli	Original screenplay and story premise
Daria Dovhenko	Visual development, AI video, titles, sound and final montage
ChatGPT image generation	Character, environment, prop and keyframe development
Seedream 4.5 / Higgsfield	Earlier casting, wardrobe and visual exploration
WAN 3.0	AI video generation, performance and dialogue passages
CapCut	Editing, color correction, music, sound and final export

The images in this portfolio are labelled as development references or final-film stills. Reference sheets document the design process; the delivered MP4 is the final viewing version.

The finished video

FULL EPISODE / CREATIVE VERSION

02:52

FORMAT	Vertical 9:16
RESOLUTION	1440 x 2560 pixels
FRAME RATE	30 fps
ENCODING	HEVC / AAC stereo
